SL6440 HIGH LEVEL MIXER

The SL6440 is a double balanced mixer intended for use in radio systems up to 150MHz. A special feature of the circuit allows external selection of the DC operating conditions by means of a resistor connected between pin 11 (bias) and Vcc When biased for a supply current of 50mA the SL6440 offers a 3rd order intermodulation intercept point of typically +30dBm, a value previously unobtainable with integrated circuits. This makes the device suitable for many applications where diode ring mixers had previously been used and offers the advantages of a voltage gain, low local oscillator drive requirement and superior isolation.

FEATURES

- +30dBm Input Intercept Point
- +15dBm Compression Point (1dB)
- Programmable Performance
- Full Military Temperature Range (SL644A)

APPLICATIONS

- Mixers in Radio Transceivers
- Phase Comparators
- Modulators

SL6440

CIRCUIT DESCRIPTION

The SL6440 is a high level mixer designed to have a linear RF performance. The linearity can be programmed using the IP pin (11).

The output pins are open collector outputs so that the conversion gain and output loads can be chosen for the specific application.

Since the outputs are open collectors they should be returned to a supply Vcc1 through a load.

The choice of Vcc1 is important since it must be ensured that the voltage on pins 3 and 14 is not low enough to saturate the output transistors and so limit the signal swing unnecessarily. If the voltage on pins 3 and 14 is always greater than Vcc2 the outputs will not saturate. The output frequency response will reduce as the output transistors near saturation.

In this case the signal will be limiting at the input before the output saturates.

The device has a separates supply (Vcc2) for the oscillator buffer (pin 4).

Fig.2 Typical application and test circuit

The current (I_P) programmed into pin 11 can be supplied via a resistor from Vcc1 or form a current source.

The conversion gain is equal to

GdB = 20 Log 56.	RL IP .61 IP + 0.078	for single-ended output
GdB = 20 Log 56.	2RL lp 61 lp + 0.078	for differential output 5
mW diss where Vo VP IP	= 2 IP Vo + = voltage o = voltage o = program	ed using the formula VPIP + Vcc2 Diss In pin 3 or pin 14 In pin 11 ming current (mA) In obtained from graph (Fig.6)

As an example Fig.7 shows typical dissipations assuming Vcc1 and Vo are equal. This may not be the case in pratice and the device dissipation will have to be calculated for any particular application.

Fig.5 shows the intermodulation performance against IP. The curves are independent of Vcc1 and Vcc2 but if Vcc1 becomes too low the output signal swing cannot be accommodated, and if Vcc2 becomes too low the circuit will not provide enough drive to sink the programmed current. Examples are shown of performance at various supply voltages.

The current in pin 14 is equal to the current in pin 3 which is equal to the current in pin 11.

APPLICATIONS

The SL6440 can be used with differential or singleended inputs and outputs. A balanced input will give bettercarrier leak The high input impedanceallowsstepup transformers to be used if desired, whilst high output impedance allows a choice of output impedance and conversion gain.

Fig. 2 shows the simplest application circuit. The input and output are single-ended and Ip is supplied from Vcc1 via a resistor. Increasing RL will increase the conversion gain, care being taken to choose a suitable value for Vcc1.

Fig. 8 shows an application with balanced input, for improved carrier leak, and balanced output for increased conversion gain. A lower Vcc1 giving lower device dissipation can be used with this arrangement.

DESIGN PROCEDURE

1. Decide on input configuration using local oscillator data. If using transformer on input, decide on ratio from noise considerations.

2. Decide on output configuration and value of conversion gain required.

3. Decide on value of IP and Vcc2 using intermodulation and compression point graphs.

4. Using values of conversion gain, Vcc2, load and Ip already chosen, decide on value of Vcc1.

5. Calculate device dissipation and decide whether heatsink is required from maximum operating temperature considerations.
