Description

CD4006BMS types are composed of 4 separate shift register sections: two sections of four stages and two sections of five stages with an output tap at the fourth stage. Each section has an independent single-rail data path.

A common clock signal is used for all stages. Data are shifted to the next stages on negative-going transitions of the clock. Through appropriate connections of inputs and outputs, multiple register sections of 4, 5, 8, and 9 stages or single register sections of 10, 12, 13, 14, 16, 17 and 18 stages can be implemented using one CD4006BMS package. Longer shift register sections can be assembled by using more than one CD4006BMS.

To facilitate cascading stages when clock rise and fall times are slow, an optional output (D1 + 4') that is delayed one-half clock-cycle, is provided (see Truth Table for Output from Term. 2).

The CD4006BMS is supplied in these 14 lead outline packages:
