TDA8215B

HORIZONTAL AND VERTICAL DEFLECTION CIRCUIT

FEATURES SUMMARY

- DIRECT LINE DARLINGTON DRIVE
- DIRECT FRAME-YOKE DRIVE (± 1A)
- COMPOSITE VIDEO SIGNAL INPUT CAPABILITY
- FRAME OUTPUT PROTECTION AGAINST SHORT CIRCUITS
- PLL
- VIDEO IDENTIFICATION CIRCUIT
- SUPER SANDCASTLE OUTPUT
- VERY FEW EXTERNAL COMPONENTS
- VERY LOWCOST POWER PACKAGE

DESCRIPTION

The TDA8215B is an horizontal and vertical deflection circuit with super sandcastle generator and video identification output. Used with TDA8213 (Video & Sound IF system) and TDA8217 (Pal decoder and video processor), this IC permits a complete low-cost solution for PAL applications. The TDA8215B has been specially designed for direct drive of line DARLINGTON transistors.

Note: 1. An RC network is connected to this input. Typical value for the resistor is 27kΩ and 220pF for the capacitor. A different time constant for RC changes the delay between the middle of the line synchro pulse and the leading edge of the burst key pulse but also the duration of the burst key pulse.

GENERAL DESCRIPTION

The TDA8215B performs all the video and power functions required to provide signals for the line driver and frame yoke.

It contains:

– A synchronization separator
– An integrated frame separator without external components
– A saw-tooth generator for the frame
– A power amplifier for direct drive of frame yoke (short circuit protected)
– An open collector output for the line darlington drive
– A line phase detector and a voltage control oscillator
– A super sandcastle generator
– Video identification output.

The slice level of sync-separation is fixed by value of the external resistors R1 and R2. VR is an internally fixed voltage.

The sync-pulse allows the discharge of the capacitor by a 2 x I current. A line sync-pulse is not able to discharge the capacitor under $V_Z/2$. A frame sync-pulse permits the complete discharge of the capacitor, so during the frame sync-pulse Q_3 and Q_4 provide current for the other parts of the circuit.

Figure 4. Synchronization Separator Circuit

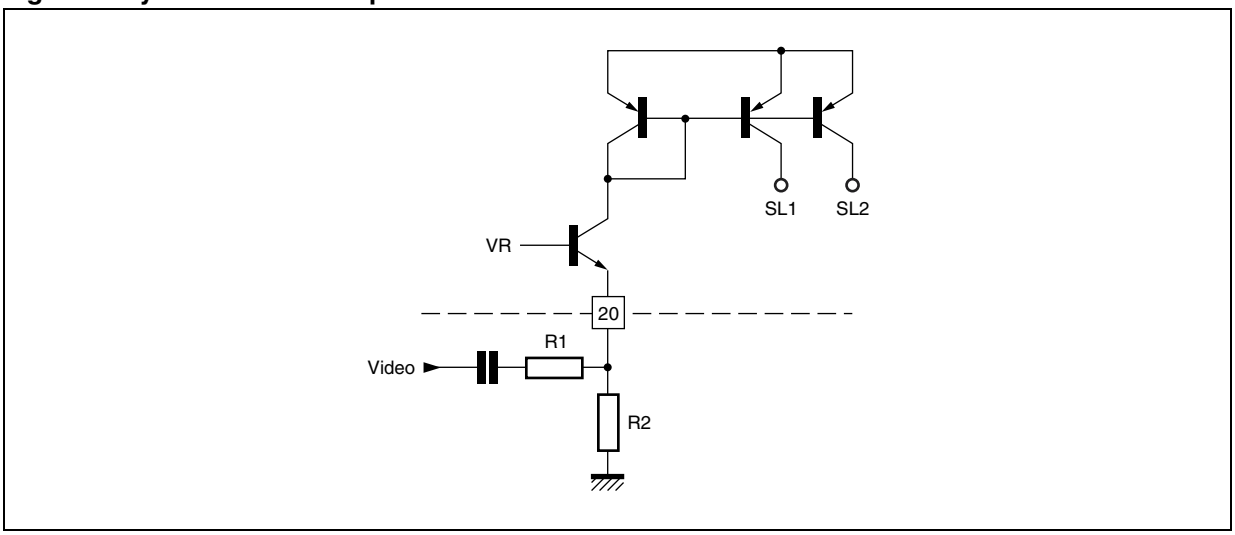

Figure 5. Frame Separator

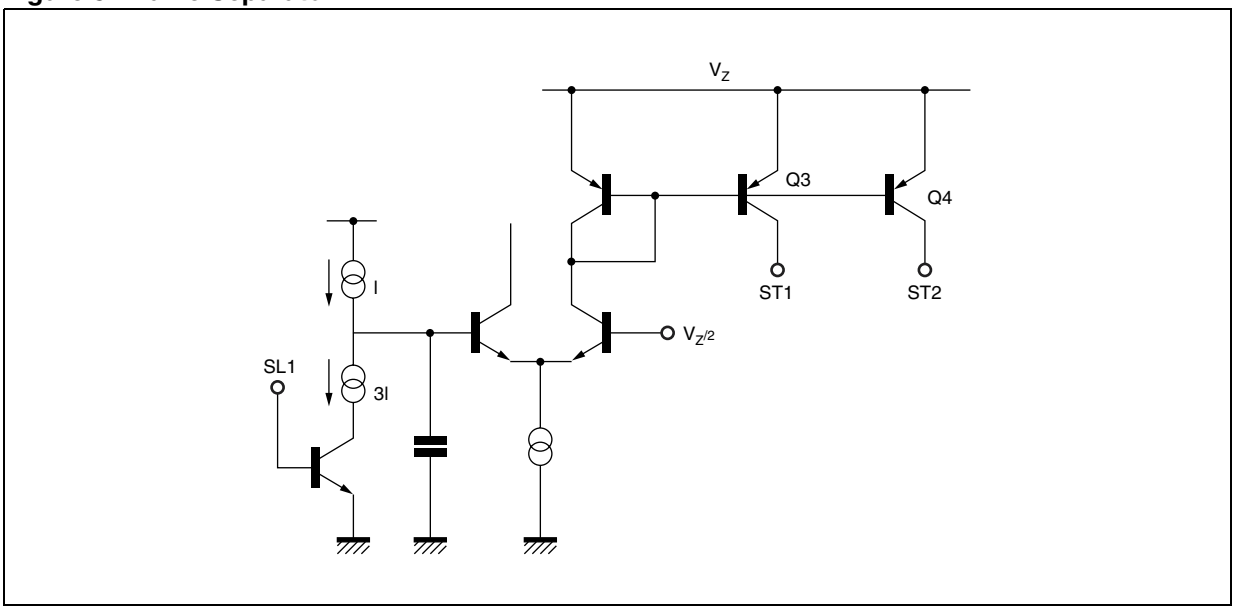

Figure 6. Line Oscillator

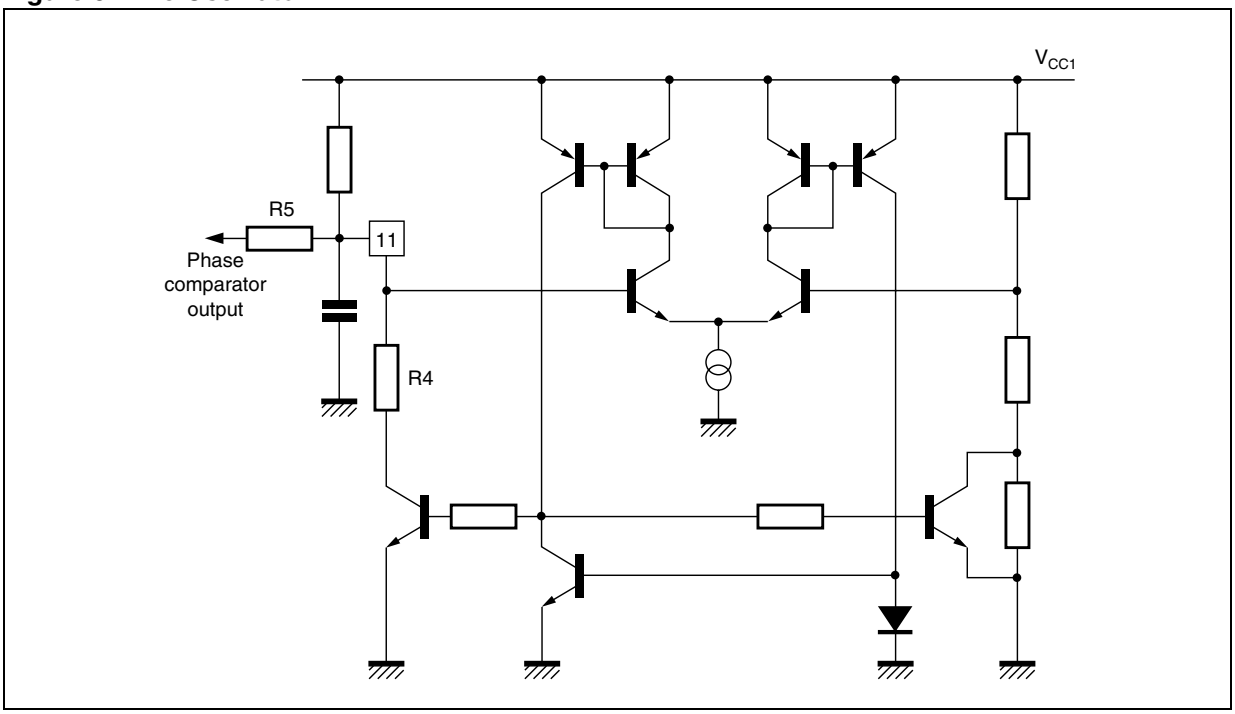

The oscillator thresholds are internally fixed by resistors. The discharge of the capacitor depends on the internal resistor R4. The control voltage is applied on resistor R5. The sync-pulse drives the current in the comparator. The line flyback integrated by the external net work gives on pin 13 a saw tooth, the DC offset of this saw tooth is fixed by VC. The comparator output provides a positive current for the part of the signal on pin 13 greater than to VC and a negative current for the other part.When the line flyback and the video signal are synchronized, the output of the comparator is an alternatively negative and positive current. The frame sync-pulse inhibits the comparator to prevent frequency drift of the line oscillator on the frame beginning.

Figure 7. Phase Comparator

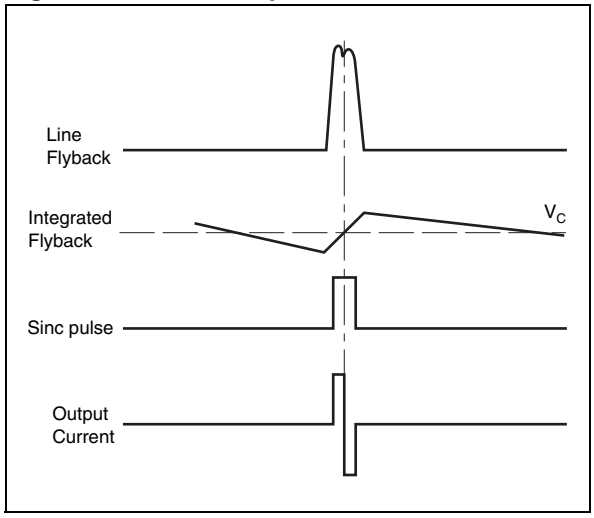

Figure 8.

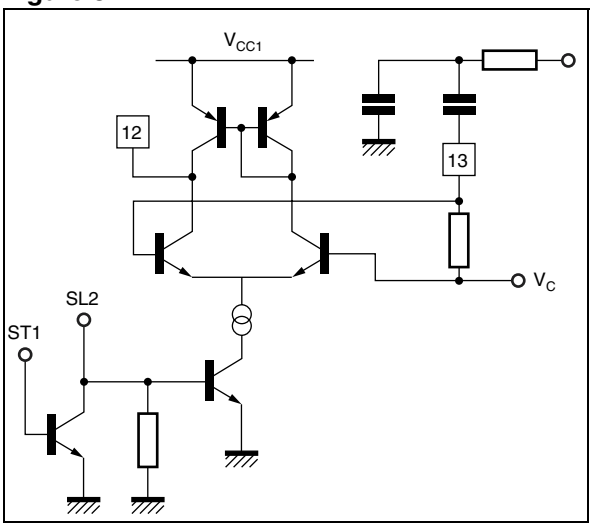
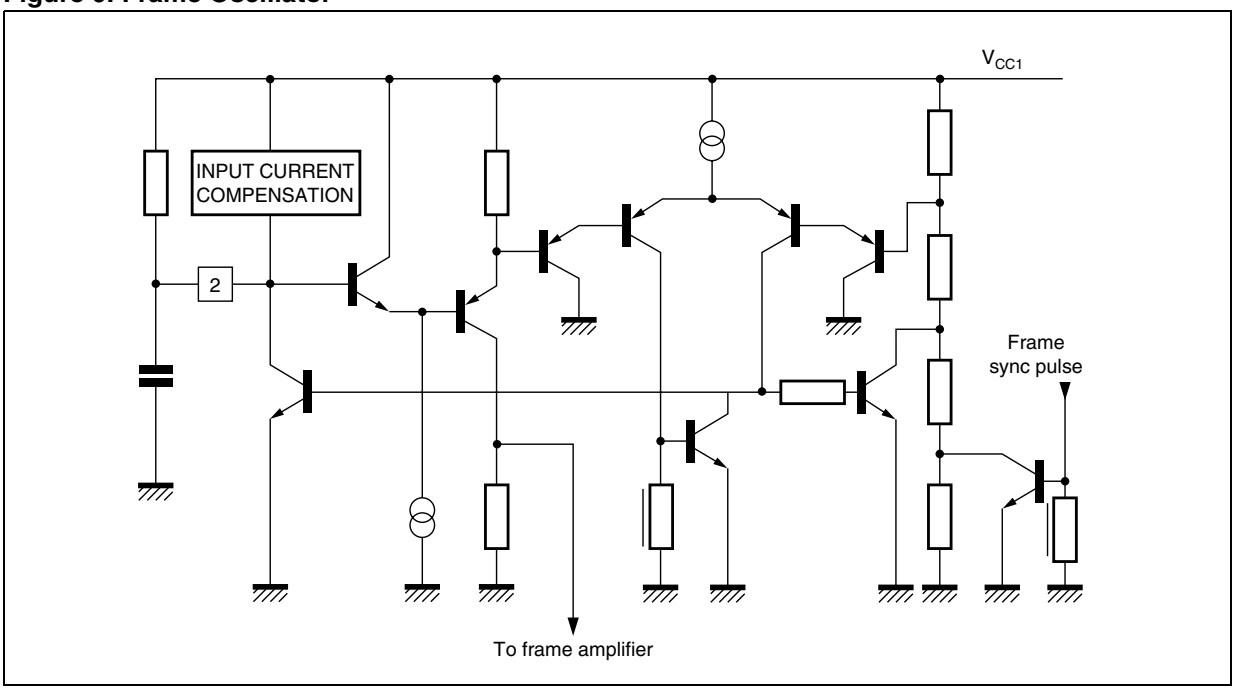


Line output (Pin 17)

It is an open-collector output. The output negative pulse time is 22µs for a 64µs period.

The oscillator thresholds are internally fixed by resistors. The oscillator is synchronized during the last half free run period. The input current during the charge of the capacitor is less than 100nA.

Figure 9. Frame Oscillator



Frame output amplifier

This amplifier is able to drive directly the frame yoke. Its output is short circuit and overload protected; it contains also a thermal protection.

The frame blanking is detected by the frame flyback generator. When the output voltage of the frame amplifier exceeds V_{CC2}-$2V_{BE}$, the pulse is detected. The line flyback detection is provided by a comparator which compares the input line flyback pulse to an internal reference. The burst gate pulse position is fixed by the external RC network (Pin 14). It is referenced to the middle of the line flyback.

This stage will detect the coincidence between the line sync pulse (if present) and a 2µs sampling pulse. This 2µs pulse is positioned at the center of line sync pulse when the phase loop is locked. This sampled detection is stored by an external capacitor Pin 8.

The identification output level is high when video signal is present.

Important remark: minimum saw-tooth amplitude on Pin 13 has to be $2V_{PP}$ (typ.: $2.5V_{PP}$).
