General Maintenance

- The mechanical switch on the keyboard is water and dust protection. Please avoid dust and water ingress. These would cause poor connection or the circuit and chip damage.

1. How to deal with dust ingress:

Remove the keycap, and clean up with brush and vacuum cleaner. Please don't turn the keyboard and pat it, or it will allow more dust to enter the switch. The reaction of dust and lubricant will make the switch unsmooth.

2. How to use the cleaning clay:

Do not put the whole clean mud on the keyboard and hard press it down, as it may flow into the body directly. We recommend rolling clean mud on the keycap slightly, and then remove the keycap, knead the mud into a small ball and roll it between the switch.

3. How to deal with water ingress:

Disconnect the keyboard, remove the keycap and clean the water. You can dry the keyboard by using hair drier and prolong drying time properly. If sugary drink seep into the switch, please replace new switch and clean residual liquid on PCB, or it will cause corrosion damage and keyboard function confusion.

TAURUS K320 Mechanical Keyboard

4. Please use the dust cover when the keyboard is not in use.
- An excellent keyboard will provide you with good experience and fun. At the same time, it also need your meticulous care. Please prevent dust and water ingress. The proper treatment will take a protection and minimize the damage.
