- Note:**
1. Response frequencies are mean values measured with standard sensing objects, each separated from one another with a distance that is double the size of the sensing object and located at a distance that is half the sensing distance.
  2. The E2E is recommended in locations where machining oil spray is present because the additives in the machining oil may damage the E2F.
  3. The tightening nuts are made of polyacetal resin.

## Precautions

**Effects of Surrounding Metals and Mutual Interference**

When mounting the Proximity Sensor flush within a metal panel or when mounting two or more identical Sensors face to face or side by side, ensure that the clearances given in the following table are maintained. Sufficient clearances prevent the Sensors from being affected by metallic objects other than the sensing object and prevent mutual interference between the two Sensors.
