### Overview

The LA7975 is an IC that converts PAL SIF signals (5.5 MHz, 6 MHz, and 6.5 MHz) to 6 MHz. For the sake of high sound quality, this IC uses a unique mixer technique to suppress interference from NICAM signals.

### Functions

- Mixer, amplifier, oscillator, oscillator mute

### Features

- Resistant to interference by NICAM signals
- Small SIP-5 package
- Wide range of usage voltage (5 V to 12 V)

- Pin 1 is the SIF input pin. The filter in Figure 2 can be connected to the input section to improve the buzz characteristic. Figure 3 shows the characteristics for the filter in Figure 2. If C1 is too small, the buzz characteristic improves for normal input, but the filter cuts into the sound carrier and the buzz characteristic deteriorates for the P/S (picture/sound carrier) ratio. Use  $C1 \approx 20 \text{ pF}$  to  $47 \text{ pF}$ .

- Pin 4 is the ceramic oscillator pin. To make the oscillation waveform approach a sine wave, the oscillation level is controlled internally. Oscillation levels of 15 to 80 mVp-p at Pin 4 give the waveform shown in Figure 5. To stop oscillation, attach an external resistor as in Figure 6 and switch S1 on.

Here are the conditions for handling multiple systems.

Input frequency	Oscillator	Pin 5 output
5.5 MHz	500 kHz	6 MHz
6.0 MHz	Oscillation stop	6 MHz (pass through)
6.5 MHz	500 kHz	6 MHz
4.5 MHz	1.5 MHz	6 MHz

- Pin 5 is the output pin. The output from Pin 5 is input to the SIF via a 6 MHz bandpass filter (BPF). When 5.5 MHz is input to Pin 1, the spectrum shown in Figure 10 is obtained at Pin 5. Even if there is a 5.85 MHz NICAM signal, the D/U (desirable/undesirable) ratio at Pin 5 increases and the buzz characteristic does not deteriorate.

When 6 MHz is input at Pin 1 and there is a 6.552 MHz NICAM signal, then 6.552 MHz is mixed with 500 kHz to make 6.052 MHz. This becomes an interference signal and is within the band for 6 MHz. Therefore, for 6 MHz input, Pin 4 is grounded with 10 kΩ to stop the oscillation and pass through the input signal 6 MHz as is.
